Pred. No. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

On Apr 12, 2001 this sequence version replaced gi:13276997.
On Apr 12, 2001 this sequence version replaced from overlapping clones.
Where differences are found these are annotated as variations
where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em. EMBL; Sw:,
SWISSPROT; Tr. TREMBL; Wp:, WORMPEP; Information on the WORMPEP
                                                                                                                                                                                                                                                     http://www.sanger.ac.uk/HGP/Chr13

RP11-178C10 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (11-APR-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
IMPORTANT: This sequence is not the entire insert of clone RP11-178C10 It may be shorter because we sequence overlappir sections only once, except for a 100 base overlap. The true right end of clone RP11-178C10 is at 98861 in this sequence. The true right end of clone RP11-461N23 is at 100 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 13, constructed by the Sanger Centre Chromosome 13 Mapping Group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This record contains 152 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* Will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 261.2; DB 2; Length 162543;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Web site: http://www.seq.wi.mit.edu

It currently consists of 2 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced
by the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 112 Row: o Column: 14
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Similarity but not identity to protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Contact: nisc_mgc@nhgri.nih.gov

                                                                                                                                                                                                                                               Baylor Plaza, Houston, TX 77030, USA.
On Nov 19, 2002 this sequence version replaced gi:22771237.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold by sized gaps filled with Ns to the estimated size. The sequence way extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Direct Submission

May 9, 2003 Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 this sequence version replaced gi:22771707.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence conly contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       * NOTE: Estimated insert size may differ from sequence length

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* Consists of I contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

I 244625: contig of 244625 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Web site: http://www.hgsc.bcm.tmc.edu/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        organism="Rattus norvegicus"

WPI; 2002-643487/69. P-PSDB; ABG32286.

New isolated G protein coupled receptor polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing cardiomyopathy, atherosclerosis, diabetes, multiple sclerosis, Crohn's disease or cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                              This invention relates to a new isolated G-protein coupled receptor (GPCRX) polypeptide sequence and the cDNA encoding it. The GPCRX polypeptide sequence and the cDNA encoding it. The GPCRX nucleic acid and an antibody specific to the protein are useful for treating, preventing or alleviating a GPCRX-associated disorder is cardiomyopathy, atherosclerosis, diabetes, or a disorder related to cell signal processing and metabolic pathway modulation. The GPCRX polypeptide and mucleic acid are also useful for diagnosing the presence of or predisposition to a disease associated with altered levels of GPCRX, particularly cancer. The GPCRX nucleic acid and polypeptide are especially useful in the manufacture of a medicament for the arapeutic or prophylactic applications for disorders associated with aberrant GPCRX expression or activity, e.g. von Hippel-Lindau syndrome, arking a disease, stroke, tuberous sclerosis, hypercalcaemia, contained a disease, Huntington's disease, cerebral palsy, epilepsy, lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, disease, osteoporosis, inflammatory bowel disease, infertility, hyman syndrome, sclerosis, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman immundeficiency virus, auroimmune disease, infertility, hyman infertility, arking are turther used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and prove endicions of pharmacogenomics. The polypeptides can be used as immunderive medicine, and prove endicions of the polypeptides can be used as immunderive medicine, and prove endicions and as a substance of the polypeptides can be used as 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pharmacogenomics. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present sequence represents the CDNA encoding a human G protein coupled receptor related protein (GPCR) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 CTGGTCTTCAGTGCCCTGGGAAACATCCTTGCCCTTTGCCTTACCTGTCAAAAGAGAGGAGG 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1539 GCGGGAAAGGACACCCGCCGGCGGCCAGCCCAGGACCCCAGTGACCAACAGGAAAGGA 3598
                                                                                                                               The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the invention.
                                                                                                                                                                                                                                                                                                                                                                                               'n,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               276

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA, Barash SC, Ruben SM

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 31289; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat discorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expression in a patient's genome that affect the activity of (1) by expressing inactive proteins or to polymucleotides may be used to produce the secreted (1), by inserting the purchain in host cell and culturing the cell to express the protein. (1) proteins and polymucleotides may be used to profess or diagnose and treat immune/haematopoietic-related diseases, especially cancer metastases of haematopoietic derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic daride genomic cancer metastases of haematopoietic antigen genomic content the present invention. AAK54952 to AAK54950 and AAM82169

```
The invention relates to human novel polymucleotides and associated polypeptides. The polymucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and responsation of neural brain tissue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1, Page 403-404; 672pp; English.

sclerosis. The sequences are involved in chemotactic or chemokinetic cativity, regulation of haematopoiesis, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, tissue repair, healing of burns, incisions, ulcers, treatment of osteoporosis, osteoarthritis, bone degenerative disorders and periodontal disease. The sequences of the invention are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders eg. multiple solerosis and mysathenia gravis, allergic conditions used as asthma, thrombolysis or thrombosis and cosquiation disorders.                                                                                                                        862
                                                                                                                                                                                     922
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging

             involving aberrant protein expression or biological activity. The polypeptide and polyunclochide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce orher types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent din not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences
(II). (I) and (II) are useful for treating disorders rotein expression or biological activity. The

Novel G protein-coupled receptor polypeptides including galanin receptor polypeptides useful for identifying modulators that are useful for treating Alzheimer's disease, psoriasis, melanoma, multiple sclerosis, The invention relates to an isolated polypeptide encoded by a nucleic acid molecule that is at least 80% identical to the g protein-coupled (GPCR) polynuclocides included in the specification. Also included are probes based on the GPCR sequences (including antisense probes), a host cell comprising an expression vector comprising the GPCR sequence. 1621 cerreaggecacegregecercargaacargaacreregecarracec-arcarraacrr 1501 GCTGATGCTGGTGGCCGTGGTGGCTTCAGCCCCCTACCACCCCCAACATCAAGTT carceceacacacarecrecerecearecreses are considered and contract of the contract CCTTCAGGCCACCGTGGCCCTCATGAACATGAACTGTGGCCATTACCCCAATCATTTACTT CITIGCATCCACCATTACAGGAAATGGCTCCTGGGCATTTTAAAGCTCAAAGGGTCTTC CTGCTTCAGCCCCTACCACCTCAACATCAAGCAGTT CATGGCGAGGATGCTCCACCTGCCATCCTGTGCCGAGCGGAGGGCTTTCTTACTGTC ss; GAL4; galanin receptor; ä Pritchard Human DNA for potential G protein-coupled receptor #88 Fabre-Suver C, protein-coupled receptor; GPCR; ciccicciccicciccicciccicc 1740 CTCCTCCTCCTCCTCCTCCTCCTC 1764 (LIFE-) LIFESPAN BIOSCIENCES INC. antibodies raised against the polypeptides, and methods of identifying modulators of the polypeptides. The polypeptides are useful for identifying modulator compounds which function as modulators, activators, repressors, agonists or antagonists of the movel GPCR polypeptides of including the GAL4 polypeptide. The antibodies and nucleic acid probes as described above can be used to detect the presence of the polypeptides of an uncleic acids and are used to diagnose a variety of disease, of ascracis in which GPCRs are involved e.g., Alzheimer's disease, a myotrophic lateral sclerosis, asthma, atheroslerosis, basal cell carcinoma, breast carcinoma, acardiomyopathy, chondrosarcoma, chronic obstructive pulmonary disease, Corbin's disease, depression, epilepsy, macular degeneration, lymphoma, melanoma, multiple sclerosis, rheumatoid arthritis, osteoporosis, Parkinson's disease, psoriasis, rheumatoid arthritis, schoporosis, Parkinson's disease, psoriasis, rheumatoid arthritis, schoporosis, parkinson's disease, psoriasis, rheumatoid arthritis, schizophrenia, ulcration. The probes and antibodies are also useful for disagnosing cognition and memory disorders, anorexia, hormonal release disorders, cardiovascular activity disorders, pain perception disorders, obesity, diabetes, Alzheimer's disease. Preferably, compounds that decrease or increase the expression of galanin receptor (GAL4) can be used to treat obesity, diabetes, hyperlipidaemia and stroke. The GPCR nucleic acid is useful for treating the above mentioned disorders by gene the invantion

New isolated nucleic acid encoding a new G-protein coupled receptor polypeptide for detecting receptor modulators that can treat mental disorders, such as schizophrenia, anxiety, depression, or obesity.

WPI; 2001-570628/64.

P-PSDB; AAU25588.

Claim 4; Page 82-83; 279pp; English.

Sequences AAS42996 FAAS42926 represent cDNA molecules and PCR primers for cDNA molecules encoding human G-protein coupled receptor (GPCR)

polypeptides. The protein and DNA sequences of the invention can be used to identify compounds which bind to GPCR polypeptides and in screening to identify compounds which bind to GPCR polypeptides and in screening or compounds that modulate GPCR activity. By screening a human subject for compounds that modulate GPCR activity. By screening a human subject for the presence of mutations in GPCR DNA, a GPCR-related disorder or a genetic predisposition can be diagnosed. The sequences can also be used for treatment and prevention of mental disorders such as schizophrenia, attention deficit disorder, anxiety, depression, dementia and bipolar disorder, neurological disorders such as Huntington's disease, parkinson's disease and Tourette's syndrome, metabolic disorders such as pobesity, anorexia and type 2 diabetes, cardiovascular disorders such as thrombosis, myocardial infarction, cardiomyopathy and atherosclerosis, viral infections caused by HIV and cancers

protein-coupled receptors termed nGPCR-x nGPGR-x polynucleotides, polypeptides, and modulators may be used in the traatment of diseases and conditions such as viral infections caused by HIV-1 (human immunodeficiency virus) or HIV-2, pain, cancers, metabolic and cardiovascular diseases and disorders (e.g., type 2 diabetes, obesity, anorexia, hypotension, myocardial infarction.

Approxia, pretransion, myocardial infarction, obsity, anorexia, hypotension, and disease, and psychotic and neurological disorders, including schizophrenia, migraine, major depression, anxiety, mental disorder, manic depression, and dyskinesias, such as Huntington's disease or Tourette's Syndrome and many other diseases and syndromes listed in the specification. nGPCR-x polymucleotides and polypebtides, as well as nGPCR-x modulators, may also be used in diagnostic assays for such diseases or conditions. The present sequence encodes a G protein-coupled receptor of the invention
